iTrade Solution

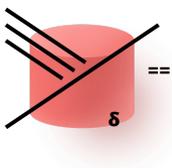

Take profit technology

You might need Ashira automated dealer if:

- You are a Forex broker and you don't STP all of your volumes
- You see that on news time some traders earn too much
- You see that some traders earn too much using scalping or arbitrage strategies
- You see that some traders earn too much using fast Expert Advisors
- You want to manage the execution for such traders
- You want to minimize your risks

How Ashira works

You set conditions when some special execution should be applied.

Schedule	Symbols	Groups & logins	Zip	Volumes	Types	Volatility	Delay	Tick delay	Forced negative slippage	Negative slippage chance	Max positive slippage	Positive slippage chance	Action
16:00+3...	*EUR*	ashiratest*	*	0-5	mk, limit	*	0.8...	2	2-5	60	20	30	
8:00+60	*	*	*	*	stop	*	10	0	0	0	0	0	
DEALER	*	1003	*	10-10000	*	*	0	0	0	0	0	0	PASS
*	GBPUSD	*	*	*	*	*	0.4...	2	1-3	100	50	70	
*	*	*	*	*	*	*	0.2	0	0	0	0	0	
**													

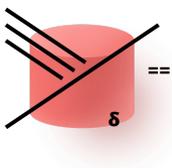

In a special period of time

Only for some symbols

Only for some order types (market, limit, stop)

Order will be executed after a randomized delay

Randomized slippage will be added

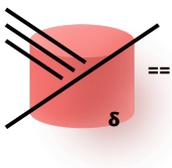

How to use Ashira to stop news traders

Schedule	Symbols	Groups & logins	Zip	Volumes	Types	Volatility	Delay	Tick delay	Forced negative slippage	Negative slippage chance	Max positive slippage	Positive slippage chance	Action
Tue 16:00	*	ecn*,976...	*	*	stop	*	15	2	0-3	80	5	40	

You know that some news are coming every Tuesday at 4 pm.

This rule created in Ashira means that every Tuesday at 4 pm stop orders will have a 15 seconds delay, execute at worst price, and get some extra negative slippage with 80% probability.

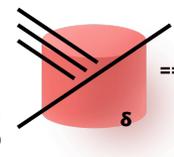

How Ashira works with scalpers

Schedule	Symbols	Groups & logins	Zip	Volumes	Types	Volatility	Delay	Tick delay	Forced negative slippage	Negative slippage chance	Max positive slippage	Positive slippage chance	Action
*	*	ecn*	*	0.01-0.1	*	*	0.2-0.3	0	0-2	50	0	0	

You have some scalpers who trade with small volumes.

This rule means that traders who open orders with a volume 0.01-0.1 lots will have a 0.2-0.3 seconds delay and some extra negative slippage.

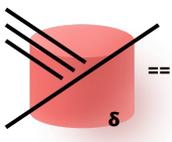

How Ashira works with arbitrage, Expert Advisors

Schedule	Symbols	Groups & logins	Zip	Volumes	Types	Volatility	Delay	Tick delay	Forced negative slippage	Negative slippage chance	Max positive slippage	Positive slippage chance	Action
*	*	ecn1*	*	0.5-1000	*	*	0.2-0.5	0	0-8	65	0	0	S

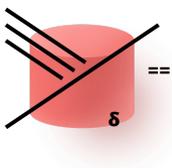

You have a special group where you put arbitrage traders and Expert Advisors users. In this example it is ecn1 group.

This rule means that traders from ecn1 group will have a random execution delay between 200 and 500 milliseconds and some extra random negative slippage.

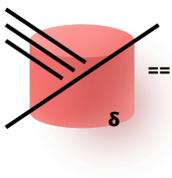

Ashira vs Virtual Dealer by Metaquotes or Panda Dealing Manager

1. Ashira is flexible in configuration.
You can make different settings for different groups, individual accounts, and symbols, all in one place.
2. Ashira has a separate configuration tool
In MQ and Panda dealers all configurations are made in the plugin's settings. So if you want to have different settings you need to install several copies of plugin. Ashira offers a very detailed yet understandable Excel-like editor for all the rules on your server, with clear separation and prioritization.
3. Ashira has an option of randomized delays and slippages.
MQ and Panda dealers have only fixed delay in milliseconds. Such delays are easily recognized by traders, and they start complaining.
In the heart of Ashira is the understanding that markets are inherently random, and to simulate market-like execution all the execution parameters must be properly but carefully randomized.

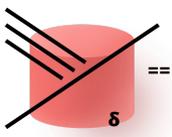

Ashira vs Tools for Brokers dealer

1. Ashira has a detailed Excel-like Graphic User Interface.
In T4B dealer all configurations are made in the text .csv file. There is a high risk to make a mistake while editing text files. Moreover, detailed graphic interface allows dealers to see the whole configuration in one place, and to keep track of all minor details of execution.
2. Ashira gives randomized delays and slippages.
“Worst price” option in T4B dealer makes it easily recognizable for traders, whereas Ashira employs several strategies that make it indistinguishable from real ECN execution.
3. Ashira has special settings against news trading.
Risk managers can easily utilize deep scheduling capabilities of Ashira to control exact details of execution of all order types at different time of day.

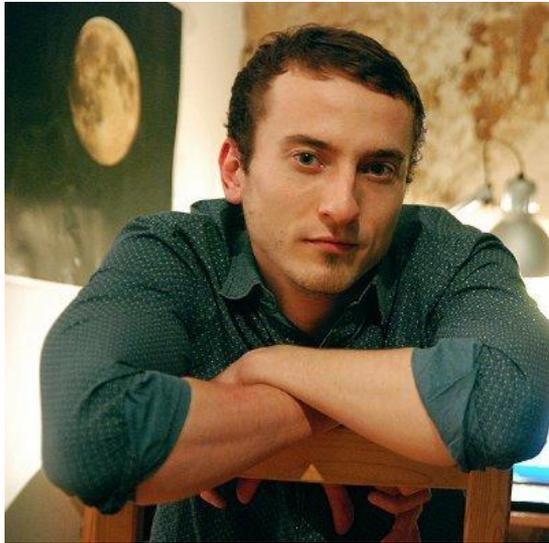

Ashira vs Dealer Logic by FXLab

1. Ashira is a lightweight plugin.
Dealer Logic weights 32 mb — a high load on your server, growing bigger as your clients trade more frequently.
2. A configuration process in Ashira is simple, compact, and real-time.
In Dealer Logic you have a list of 50+ complicated and self-contradicting parameters in your MT4 Admin which is very difficult to manipulate urgently out of fear of breaking things.
3. Ashira is compatible with other plugins.
Too many parameters may render Dealer Logic incompatible with other plugins, bridges, and tools.

Pay attention that Ashira dealer has a two-month money back guarantee

Write or call your manager to get a two-week free Ashira dealer testing
